Nutrition Tools
TOOL A

Nutrition Questionnaire for Infants

The nutrition questionnaire for infants is a tool for parents to complete before meeting with a health professional. The questionnaire provides a useful starting point for identifying areas of nutrition concern and determining whether additional screening is needed. When reviewing responses to the questionnaire, use the following interpretive notes to identify areas of concern and determine follow-up questions or actions. The notes are numbered according to their corresponding questions on the questionnaire.

INTERPRETIVE NOTES

1. Feeding is crucial for the development of a healthy relationship between parents and their infant. A parent’s responsiveness to an infant’s cues of hunger and satiety and the close physical contact during feeding facilitate healthy social and emotional development.

2. Signs of hunger include hand-to-mouth activity, rooting, pre-cry facial grimaces, fussing sounds, reaching for utensils, and crying. Signs of fullness include turning the head away from the nipple, showing interest in things other than eating, playing with food, and closing the mouth.

3. Infants should be fed breast milk or iron-fortified infant formula, even in infant cereal. If infants are weaned from breast milk before age 12 months, they should be fed iron-fortified infant formula rather than cow’s milk. Cow’s milk, goat’s milk, and soy milk are not recommended during the first 12 months of life.

4. In establishing realistic feeding goals for infants, it is important to assess an infant’s developmental readiness for eating foods with different textures as well as her self-feeding skills. Before beginning to eat from a spoon, infants should be able to hold their heads upright and move their tongues from side to side.

5. Complementary (solid) foods can be introduced between ages 4 and 6 months when the infant is developmentally ready. After the infant has accepted iron-fortified infant cereal, then pureed or soft fruits, vegetables, and meats can be offered. Only one new food should be introduced at a time; parents should wait 3 to 5 days to see how the infant tolerates the food (observe for signs of allergic reaction). There is no research to support a particular order when introducing new foods.
Between ages 6 and 12 months, infants master chewing, swallowing, and manipulation of finger foods. They begin to use cups and utensils, and while they are experimenting with new tastes and textures, their sensory and perceptual development are stimulated.

6. Juice should not be given to infants younger than 6 months. After age 6 months, serve only 100% fruit juice in a cup instead of a bottle and limit it to 4 to 6 oz per day. It should be offered in small amounts (more than 6 oz per day is excessive), because too much juice may reduce the infant’s appetite for other foods and increases the risk of loose stools and diarrhea.

7. Infants permitted to suck on a bottle of any fluid that contains carbohydrates, including juice and milk, for prolonged periods are at risk for developing dental caries (tooth decay). Infants should not be put to bed at night or at naptime with a bottle or allowed unlimited access to a bottle (ie, permitting the infant to carry a bottle around whenever he wants).

8. Honey should not be added to food, water, or formula that is fed to infants, because it can be a source of spores that cause botulism poisoning in infants. Processed foods containing honey should not be given to infants.

9. Starting at age 6 months, infants receiving breast milk only or infant formula prepared with water need fluoride supplementation if the water is severely deficient in fluoride. To assess fluoride levels, ask about all sources of water used by the family, including municipal, well, commercially bottled, and home system–processed water. In addition, find out whether any ready-to-feed infant formula used is manufactured with water that has little or no fluoride. Refer an infant who is not getting enough fluoride to a dentist or primary care health professional for follow-up.

10–11. If inadequate cooking or food-storage facilities adversely affect a family’s nutrient intake, refer the family to social services. If a family does not have adequate resources to obtain food, refer them to nutrition assistance programs such as the Special Supplemental Nutrition Program for Women, Infants and Children (WIC) and the Supplemental Nutrition Assistance Program (SNAP) or to a community food shelf or pantry. (See Tool K: Federal Nutrition Assistance Programs.)

12. Respond to parents’ questions and concerns.
TOOL A: NUTRITION QUESTIONNAIRE FOR INFANTS

1. How would you describe feeding time with your baby? *(Check all that apply.)*
   - □ Always pleasant
   - □ Usually pleasant
   - □ Sometimes pleasant
   - □ Never pleasant

2. How do you know when your baby is hungry or has had enough to eat?

3. What type of milk do you feed your baby, and how often? *(Check all that apply.)*
   - □ Breast milk
   - □ Iron-fortified infant formula
   - □ Evaporated milk
   - □ Whole milk
   - □ Reduced-fat (2%) milk
   - □ Low-fat (1%) milk
   - □ Fat-free (skim) milk
   - □ Goat’s milk
   - □ Soy milk

4. What types of things can your baby do? *(Check all that apply.)*
   - □ Open mouth for breast or bottle
   - □ Drink liquids
   - □ Follow objects and sounds with eyes
   - □ Put hand in mouth
   - □ Sit with support
   - □ Bring objects to mouth and bite them
   - □ Hold bottle without support
   - □ Drink from a cup that is held

5. Does your baby eat solid foods? If yes, which ones?

6. Does your baby drink juice? If yes, how much?

7. Does your baby take a bottle to bed at night or carry a bottle around during the day?
8. Do you add honey to your baby’s bottle or dip your baby’s pacifier in honey?

9. What is the source of the water your baby drinks? Sources include public, well, commercially bottled, and home system–processed water.

10. Do you have a working stove, oven, and refrigerator where you live?

11. Were there any days last month when your family didn’t have enough food to eat or enough money to buy food?

12. What concerns or questions do you have about feeding your baby or how your baby is growing? Do you have any concerns or questions about your baby’s weight?
The nutrition questionnaire for children is a tool for parents to complete before meeting with a health professional. The questionnaire provides a useful starting point for identifying areas of nutrition concern and determining whether additional screening is needed. When reviewing responses to the questionnaire, use the following interpretive notes to identify areas of concern and to determine follow-up questions or actions. The notes are numbered according to their corresponding questions on the questionnaire.

**INTERPRETIVE NOTES**

1. Children grow more slowly from ages 1 to 5 than in infancy. Their appetites can change from day to day, depending on how fast they are growing and how active they are. As long as they are energetic and growing, they are probably getting enough of the nutrients they need. Young children often eat small portions. They should be offered small servings and should be allowed to ask for more. Irregular eating and frequently missing meals can result in an insufficient intake of calories (energy) and nutrients. Busy schedules and inadequate resources for obtaining food may cause children to miss meals.

2. Encourage parents to eat meals together as a family. If children see their parents and other adults enjoying meals together and eating a variety of foods, they will want to do the same. Explain that being a role model is the best way to teach. Allow children to engage in age-appropriate meal preparation activities, such as washing vegetables or helping to prepare a side dish.

3. During mealtimes, a relaxed atmosphere should be maintained, and parents should make an effort not to rush children. Encourage parents to get rid of distractions such as television during meals. Well-balanced meals and snacks should be offered in a pleasant environment. When children are stubborn about eating, it is often their way of learning to be independent. Fighting over food may make them even more stubborn.
4. Children need between 4 and 6 meals and snacks each day; these should be offered at scheduled times and should consist of a variety of healthy foods. Children should be allowed to decide whether and how much to eat at each meal or snack; they should not be pressured to eat certain foods or rewarded for eating certain foods.

5. Children ages 2 to 3 need the same variety of foods and the same number of servings as older children but may need smaller portions—about two-thirds of a serving for each serving that older children eat. By the time children are 4 years old, they need serving sizes similar to those eaten by older family members: 1 slice of bread; 1 cup of raw vegetables; 1 medium-sized piece of fruit; 1 cup of milk or yogurt; and 2 to 3 oz of cooked lean meat, poultry, or fish.

Grains. Grain products provide vitamins, minerals, complex carbohydrates, and dietary fiber, which are important for good health. Children need 3 to 6 oz (6–11 servings) per day of grains, of which at least half should be whole grains.

Vegetables. Vegetables are an important source of many nutrients, including potassium; folic acid; vitamins A, E, and C; and fiber. Children need 1 to 2½ cups (3–5 servings) per day.

Fruits. Fruits provide vitamins, minerals, and dietary fiber. Children need 1 to 1½ cups (2–4 servings) per day. Many juice beverages are not 100% juice. Parents need to check the ingredients to make sure that they purchase juice without added sugar such as corn syrup. If parents purchase canned or packaged fruits, they should choose varieties with little or no added sugar.

Milk and milk products. Milk, yogurt, cheese, and other milk products supply calcium for building and maintaining strong bones and teeth and protecting bones from osteoporosis. Children need 2 to 3 servings per day. Children ages 1 to 2 need whole milk. After age 2, children should gradually increase the proportion of low-fat foods in their diets. For children older than 2, low-fat (1%) or fat-free (skim) milk is recommended. Reduced-fat milk (2%) is recommended for children ages 1 to 2 years for whom obesity is a concern or who have a family history of obesity, dyslipidemia, or cardiovascular disease.

Meat and meat alternatives. Meat and meat alternatives include both animal and plant sources of protein, iron, and other important nutrients. Children need 2 to 5 oz (2–3 servings) per day. Between 2 and 3 oz of cooked lean meat, poultry, or fish equal one serving from this group. One egg or ½ cup of cooked dry beans counts as 1 oz of lean meat; 2 tablespoons of peanut butter count as 1 oz of meat.

Fats and sweets. This group includes butter, margarine, mayonnaise, vegetable oil, gravy, salad dressing, cake/cupcakes, pie, cookies, chips, doughnuts, and candy. There is no recommended serving. Consumption of fats and sweets should be limited. If allowed to consume sweets in unlimited amounts, children are likely to fill up on these rather than eat healthy foods.

6. For children younger than 3, foods that may cause choking need to be avoided (eg, hard or chewy candy, mini-marshmallows, popcorn, pretzels, chips, spoonfuls of peanut butter, nuts, seeds, large chunks of meat, hot dogs, raw carrots, raisins and other dried fruits, whole grapes). Young children, especially 3-year-olds, are at risk for choking on food and remain at risk until they can chew and swallow better (at about age 5).

Precautions to prevent choking include:
- Staying with children while they are eating.
- Having children sit while eating, because eating while walking or running can cause choking.
- Keeping things calm during meal or snack times, because becoming excited while eating can cause choking.
- Observing children who have received rub-on teething medications, because these medications may affect chewing and swallowing.
• Avoiding eating in the car. If the parent is driving, helping a choking child will be difficult.
For children ages 3 to 5, foods that may cause choking can be modified to make them safer (eg, by cutting hot dogs in quarters lengthwise and then into small pieces, cutting whole grapes in half lengthwise, chopping nuts finely, chopping raw carrots finely or into thin strips, spreading peanut butter thinly on crackers or bread).

7. Juice should be offered in small amounts because too much juice may reduce a child’s appetite for food. Serve only 100% fruit juice. Limit juice consumption to 4 to 6 oz per day. Parents should also limit sweetened drinks such as fruit punch, soft drinks, lemonade, and other sweetened beverages.

8. Children permitted to suck on a bottle of any fluid that contains carbohydrates, including juice and milk, for prolonged periods are at risk for developing dental caries (tooth decay). Children should not be put to bed at night or at naptime with a bottle or allowed unlimited access to a bottle (ie, permitting the child to carry a bottle around whenever she wants).

9. Children need fluoride supplementation if the water is severely deficient in fluoride. To assess fluoride levels, ask about all sources of water used by the family, including municipal, well, commercially bottled, and home system–processed water. Refer a child who is not getting enough fluoride to a dentist or primary care health professional for follow-up.

10–11. If inadequate cooking or food–storage facilities adversely affect a family’s nutrient intake, refer the family to social services. If a family does not have adequate resources to obtain food, refer them to nutrition assistance programs such as the National School Lunch Program (NSLP), the Special Supplemental Nutrition Program for Women, Infants and Children (WIC) and the Supplemental Nutrition Assistance Program (SNAP), or to a community food shelf or pantry. (See Tool K: Federal Nutrition Assistance Programs.)

12. Children can achieve substantial health benefits by doing moderate- and vigorous-intensity physical activity for a total of 60 minutes or more each day. This should include aerobic activity as well as age-appropriate muscle- and bone-strengthening (weight-bearing) activities. The benefits of physical activity include giving children a feeling of accomplishment, reducing the risk of certain diseases (eg, diabetes mellitus, hypertension) if they continue to be active during adulthood, helping children achieve or maintain a healthy weight, and promoting mental health. Help the inactive child identify enjoyable activities and incorporate them into a daily routine.

13. Children who spend too much time watching television and DVDs or playing computer games are likely to have a sedentary lifestyle, which can lead to overweight. These activities should be limited to 1 to 2 hours per day.

14. Watching television during mealtimes is a distraction that prevents family interaction and interferes with a child’s eating. Value the time spent together while eating. Often it is the only time during the day that families can be together.

15. Respond to parents’ questions and concerns.
**TOOL B: NUTRITION QUESTIONNAIRE FOR CHILDREN AGES 1 TO 10**

1. How would you describe your child’s appetite?
   - [ ] Good
   - [ ] Fair
   - [ ] Poor

2. How many days per week does your family eat meals together?

3. How would you describe mealtimes with your child?
   - [ ] Always pleasant
   - [ ] Usually pleasant
   - [ ] Sometimes pleasant
   - [ ] Never pleasant

4. How many meals does your child eat per day? How many snacks?

5. Which of these foods did your child eat or drink last week? (Check all that apply.)

   **Grains**
   - [ ] Bagels
   - [ ] Bread
   - [ ] Cereal/grits
   - [ ] Crackers
   - [ ] Muffins
   - [ ] Noodles/pasta/rice
   - [ ] Rolls
   - [ ] Tortillas
   - [ ] Other grains: __________________

   **Vegetables**
   - [ ] Broccoli
   - [ ] Carrots
   - [ ] Corn
   - [ ] Green beans
   - [ ] Green salad
   - [ ] Greens (collard, spinach)
   - [ ] Peas
   - [ ] Potatoes
   - [ ] Tomatoes
   - [ ] Other vegetables: __________________

   **Fruits**
   - [ ] Apples/juice
   - [ ] Bananas
   - [ ] Grapefruit/juice
   - [ ] Grapes/juice
   - [ ] Melon
   - [ ] Oranges/juice
   - [ ] Peaches
   - [ ] Pears
   - [ ] Other fruits/juice: ______________

   **Milk and Milk Products**
   - [ ] Fat-free (skim) milk
   - [ ] Low-fat (1%) milk
   - [ ] Reduced-fat (2%) milk
   - [ ] Whole milk
   - [ ] Flavored milk
   - [ ] Cheese
   - [ ] Ice cream
   - [ ] Yogurt
   - [ ] Other milk and milk products: __________________

   **Meat and Meat Alternatives**
   - [ ] Beef/hamburger
   - [ ] Chicken
   - [ ] Cold cuts/deli meats
   - [ ] Dried beans (for example, black beans, kidney beans, pinto beans)
   - [ ] Eggs
   - [ ] Fish
   - [ ] Peanut butter/nuts
   - [ ] Pork
   - [ ] Sausage/bacon
   - [ ] Tofu
   - [ ] Turkey
   - [ ] Other meat and meat alternatives: __________________

   **Fats and Sweets**
   - [ ] Cake/cupcakes
   - [ ] Candy
   - [ ] Chips
   - [ ] French fries
   - [ ] Cookies
   - [ ] Doughnuts
   - [ ] Fruit-flavored drinks
   - [ ] Pie
   - [ ] Soft drinks
   - [ ] Other fats and sweets: ______________
6. If your child is 5 years or younger, does he or she eat any of these foods? (Check all that apply.)
- Hot dogs
- Marshmallows
- Nuts and seeds
- Peanut butter
- Popcorn
- Pretzels and chips
- Raisins
- Raw celery or carrots
- Hard or chewy candy
- Whole grapes

7. How much juice does your child drink per day? How much sweetened beverage (for example, fruit punch or soft drinks) does your child drink per day?

8. Does your child take a bottle to bed at night or carry a bottle around during the day?
   - Yes
   - No

9. What is the source of the water your child drinks? Sources include public, well, commercially bottled, and home system-processed water.

10. Do you have a working stove, oven, and refrigerator where you live?
    - Yes
    - No

11. Were there any days last month when your family didn’t have enough food to eat or enough money to buy food?

12. Did you participate in physical activity (for example, walking or riding a bike) in the past week?
    - Yes
    - No

13. Does your child spend more than 2 hours per day watching television and DVDs or playing computer games?
    - Yes
    - No

14. Does the family watch television during meals?
    - Yes
    - No

15. What concerns or questions do you have about feeding your child or how your child is growing? Do you have any concerns or questions about your child’s weight?
The nutrition questionnaire for adolescents is a tool for adolescents or parents to complete before meeting with a health professional. The questionnaire provides a useful starting point for identifying areas of nutrition concern and determining whether additional screening is needed.

When reviewing responses to the questionnaire, use the following interpretive notes to identify areas of concern and determine follow-up questions or actions. The notes are numbered according to their corresponding questions on the questionnaire.

**INTERPRETIVE NOTES**

**EATING BEHAVIORS**

1–2. Irregular eating and frequently missing meals can result in a low intake of calories (energy) and nutrients. Busy schedules and inadequate resources for obtaining food may cause an adolescent to miss meals. Reinforce the importance of eating 3 meals instead of frequent snacks per day.

3. Adolescents who are on their own for most meals—perhaps because of a busy schedule—may not have healthy eating behaviors. Remind adolescents and parents that family meals ensure optimal nutrition and encourage communication. Explain to parents that family meals give them the opportunity to model healthy eating behaviors.

4. Shopping for and preparing food give adolescents the opportunity to learn about healthy food choices. Make sure the adolescent is familiar with the basic rules of food safety. (See Tool H: Basics for Handling Food Safely.)
5. Consumption of convenience and fast foods is common among Americans. Frequent consumption increases fat, caloric, and sodium intake and reduces the intake of certain vitamins and minerals. Suggest that adolescents limit the consumption of these foods, and offer suggestions for making healthier food choices when eating away from home.

6. If the adolescent is on a special diet, ask, “What kind of diet are you on?” This will provide an opportunity to evaluate the adolescent’s dietary management of conditions such as diabetes mellitus or food allergies. Refer to a registered dietitian, if appropriate.

7. Individuals’ interpretations of the meaning of the term vegetarian can vary greatly. Ask adolescents who are vegetarian to name the foods they eliminate from their diet as a vegetarian. Further dietary assessment is recommended.

8. Changes (either increases or decreases) in weight or appetite may indicate depression or other emotional stress, and they warrant further assessment. Changes in weight or appetite may also indicate that an adolescent is engaging in restrictive dieting or disordered eating, which may predispose them to an eating disorder. Detailed dietary and psychological assessments are recommended.

9. Soft drinks, fruit-flavored drinks, sports drinks, energy drinks, and recovery drinks may displace healthier beverages (eg, milk, which provides calcium, protein, and vitamins; orange juice, which is an important source of vitamin C and folate).

Food Choices

10. Grains. Grains supply complex carbohydrates (which are important sources of energy), protein, and minerals; they also tend to be low in fat. Whole grains are a good source of dietary fiber. Six to 11 servings (5–7 oz) of grains per day are recommended; at least half of these servings should be whole grains.

Vegetables. Vegetables are an important source of many nutrients, including potassium; folic acid; vitamins A, E, and C; and fiber. Two to 3 cups of vegetables per day are recommended, depending on age and gender.

Fruits. Fruits are important sources of vitamins and fiber and are low in fat. Citrus fruits and juices, strawberries, and cantaloupe are good sources of vitamin C and folate. One and one-half to 2 cups of fruits per day are recommended, based on age and gender.

Milk and milk products. Milk, yogurt, and cheese are good sources of calcium and provide protein, vitamins, and minerals. Three or more servings per day of milk and milk products are recommended. Encourage the adolescent to consume reduced-fat (2%), low-fat (1%), or fat-free (skim) milk and other lower-fat milk products. Adequate calcium intake during adolescence is essential for peak bone mass development. If the recommended calcium intake cannot be met by diet, a supplement may be warranted. Of the various forms of calcium, calcium carbonate contains the highest proportion (40%) of elemental calcium by weight.

Meat and meat alternatives. Red meat, poultry, fish, eggs, and dried beans provide protein, iron, zinc, and many other minerals and vitamins. Adequate protein intake is essential for growth and development. Two to 3 servings (or 5–6 oz) of meat or meat alternatives per day are recommended. Cold cuts, bacon, sausage, and fried meats are high in fat and calories; therefore, their consumption should be limited.

Fats and sweets. This group includes butter, margarine, mayonnaise, vegetable oil, gravy, salad dressing, cake, cupcakes, pie, cookies, chips, doughnuts, and candy. There is no recommended serving because consumption of fats and sweets should be limited.

Food Resources

11–12. If inadequate cooking or food-storage facilities adversely affect a family’s nutrient intake, refer the family to social services. If a family does not have adequate resources to obtain food, refer the family to nutrition assistance programs such
as the National School Lunch Program (NSLP) and the Supplemental Nutrition Assistance Program (SNAP), or to a community food shelf or pantry. (See Tool K: Federal Nutrition Assistance Programs.)

**Weight and Body Image**

13. Some adolescents may be dissatisfied with their weight and use unhealthy means to alter it. If the adolescent expresses a concern about weight, follow up with questions such as “How would you classify your weight?” or “Are you doing anything to try to change your weight?”

14. If the adolescent is dieting, determine the frequency, duration, and methods of weight loss. Chronic food restriction and inadequate energy intake may cause poor growth, delayed sexual development, menstrual irregularities, poor concentration, irritability, sleep difficulties, and constipation. Frequent dieting may be associated with binge eating. Purging (eg, self-induced vomiting, laxative use) may be associated with other risk behaviors (eg, substance use, suicide attempts).

15. Self-induced vomiting; the use of laxatives, diuretics, or diet pills; or both are warning signs of eating disorders. Adolescents who engage in these behaviors need further assessment.

**Physical Activity**

16. Adolescents can achieve substantial health benefits by doing moderate- and vigorous-intensity physical activity for a total of 60 minutes or more each day. This should include aerobic activity as well as age-appropriate muscle- and bone-strengthening (weight-bearing) activities. The benefits of physical activity include giving adolescents a feeling of accomplishment, reducing the risk of certain diseases (eg, diabetes mellitus, hypertension) if they continue to be active during adulthood, and promoting mental health. Help the inactive adolescent identify enjoyable activities and incorporate them into a daily routine.

Some adolescents engage in physical activity to compensate for caloric intake as a form of purging. Excessive physical activity (>2 hours per day) may lead to fatigue, loss of appetite, or menstrual irregularities and may be a sign of an eating disorder.

**Lifestyle**

17. Adolescents who spend too much time watching television and DVDs or playing computer games are likely to have a sedentary lifestyle, which can lead to overweight. These sedentary activities should be limited to 1 to 2 hours per day.

18. Watching television during mealtimes is a distraction that prevents family interaction and interferes with a child’s eating. Value the time spent together while eating. Often it is the only time during the day that families can be together.

19. If the adolescent uses vitamin, mineral, herbal, or other dietary supplements, ask about the kind, dosage, length of use, and reason for use. Encourage the adolescent to eat healthy foods instead of using supplements to obtain nutrients. If the adolescent is interested in vitamin supplements, emphasize the importance of using low-dose supplements and the need to avoid high doses (particularly of vitamin A), which can be toxic.

Adolescents who engage in physical activities in which strength is a critical factor (eg, football, weightlifting) may consume a high-protein diet or take protein supplements in an attempt to increase strength and muscle mass. However, increased protein intake does not affect muscle size.

Adolescents who use protein supplements should be asked about anabolic steroid use. Some adolescents take anabolic steroids to enhance their strength, muscle size, and endurance. Steroid use can cause side effects, including acne, deepening of the voice, and hair recession.

20. Unhealthy behaviors occur in clusters in adolescents. For example, adolescents who smoke are more likely to have unhealthy eating behaviors and low levels of physical activity. Adolescents who smoke to lose weight need counseling on both smoking and healthy weight management. Cigarette smoking also increases the need for vitamin C.
21. If the adolescent admits to using alcohol or street drugs, screen for substance abuse, and refer for counseling and treatment. (Refer to CRAFFT, a behavioral health screening tool for use with children and adolescents younger than 21).

Some adolescents take anabolic steroids to enhance their strength, muscle size, and endurance. Steroid use can cause side effects, including acne, deepening of the voice, and hair recession. Emphasize the dangers of steroid use to adolescents who engage in strenuous physical activity to build muscle or who participate in sports in which strength is a critical factor (eg, football, weightlifting).
1. Which of these meals or snacks did you eat yesterday? (Check all that apply.)
   - Breakfast
   - Lunch
   - Dinner or supper
   - Morning snack
   - Afternoon snack
   - Evening/late-night snack

2. Do you skip breakfast 3 or more times a week?
   - Yes
   - No

  Do you skip lunch 3 or more times a week?
   - Yes
   - No

  Do you skip dinner or supper 3 or more times a week?
   - Yes
   - No

3. Do you eat dinner or supper with your family 4 or more times a week?
   - Yes
   - No

4. Do you fix or buy the food for any of your family's meals?
   - Yes
   - No

5. Do you eat or take out a meal from a fast-food restaurant 2 or more times a week?
   - Yes
   - No

6. Are you on a special diet for medical reasons?
   - Yes
   - No

7. Are you a vegetarian?
   - Yes
   - No

8. Do you have any problems with your appetite, like not feeling hungry, or feeling hungry all the time?
   - Yes
   - No

9. Which of the following did you drink last week? (Check all that apply.)
   - Tap or bottled water
   - Fitness water
   - Juice
   - Regular soft drinks
   - Diet soft drinks
   - Fruit-flavored drinks
   - Sports drinks
   - Energy drinks
   - Recovery drinks
   - Fat-free (skim) milk
   - Low-fat (1%) milk
   - Reduced-fat (2%) milk
   - Whole milk
   - Flavored milk (for example, chocolate, strawberry)
   - Coffee or tea
   - Beer, wine, or hard liquor

10. Which of these foods did you eat last week? (Check all that apply.)
    - Grains
      - Bagels
      - Bread
      - Cereal or grits
      - Crackers
      - Muffins
      - Noodles, pasta, or rice
      - Rolls
      - Tortillas
      - Other grains: __________________

6. Do you have a working stove, oven, and refrigerator where you live?
   - Yes
   - No

7. Were there any days last month when your family didn't have enough food to eat or enough money to buy food?
   - Yes
   - No

8. Are you concerned about your weight?
   - Yes
   - No

9. Are you on a diet now to lose weight or to maintain your weight?
   - Yes
   - No

10. In the past year, have you tried to lose weight or control your weight by vomiting, taking diet pills or laxatives, or not eating?
    - Yes
    - No

11. Did you participate in physical activity (for example, walking or riding a bike) in the past week?
    - Yes
    - No

    If yes, on how many days and for how many minutes or hours per day? ______________

12. Do you spend more than 2 hours per day watching television and DVDs or playing computer games?
    - Yes
    - No

    If yes, how many hours per day? __________

13. Does the family watch television during meals?
    - Yes
    - No

14. Do you take vitamin, mineral, herbal, or other dietary supplements (for example, protein powders)?
    - Yes
    - No

15. Do you smoke cigarettes or chew tobacco?
    - Yes
    - No

16. Do you ever use any of the following? (Check all that apply.)
    - Alcohol, beer, or wine
    - Yes
    - No
    - Steroids (without a doctor's permission)
    - Yes
    - No
    - Street drugs (marijuana, speed, crack, or heroin)
    - Yes
    - No
## Key Indicators of Nutrition Risk for Children and Adolescents

<table>
<thead>
<tr>
<th>INDICATORS OF NUTRITION RISK</th>
<th>RELEVANCE</th>
<th>CRITERIA FOR FURTHER SCREENING AND ASSESSMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Food Choices</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Consumes &lt;2 servings of fruits per day. Consumes &lt;3 servings of vegetables per day.</td>
<td>Fruits and vegetables provide vitamins (such as A and C), minerals, and fiber. Low intake of fruits and vegetables is associated with an increased risk of many types of cancer.</td>
<td>Assess the child or adolescent who is consuming &lt;1 serving of fruit per day. Assess the child or adolescent who is consuming &lt;2 servings of vegetables per day.</td>
</tr>
<tr>
<td>Consumes &lt;6 servings of cereal, bread, crackers, pasta, rice, or other pasta per day. Consumes &lt;3 servings of whole grains per day.</td>
<td>Grain products provide complex carbohydrates, vitamins, minerals, and fiber. Low intake of fiber is associated with constipation and increased risk of colon cancer.</td>
<td>Assess the child or adolescent who is consuming &lt;6 servings of cereal, bread, crackers, rice, pasta, or other grains per day. Assess the child or adolescent who is consuming &lt;3 servings of whole-grain cereal, bread, crackers, rice, pasta, or other grains per day. Assess the child or adolescent who has recent history of constipation.</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td><strong>Food Choices, continued</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>For children &lt;9:</td>
<td>Consumes &lt;2 servings of milk and milk products per day.</td>
<td>Assess the child (&lt;9) who is consuming &lt;1 serving of milk and milk products per day.</td>
</tr>
<tr>
<td>For children ages ≥9 and adolescents:</td>
<td>Consumes &lt;3 servings of milk and milk products per day.</td>
<td>Assess the child (≥9) or adolescent who is consuming &lt;2 servings of milk and milk products per day.</td>
</tr>
<tr>
<td></td>
<td>Milk and milk products are a good source of protein, vitamins, and calcium and other minerals. Low intake of milk and milk products may reduce peak bone mass and increase the risk of osteoporosis.</td>
<td>Assess the child who has a milk allergy or is lactose intolerant. Assess the child who is consuming &gt;2 soft drinks per day.</td>
</tr>
<tr>
<td>Consumes &lt;2 servings of meat or meat alternatives (eg, beans, eggs, nuts, seeds) per day.</td>
<td>Protein-rich foods (eg, meats, meat alternatives) are good sources of B vitamins, iron, and zinc. Low intake of protein-rich foods may impair growth and increase the risk of iron-deficiency anemia and of delayed growth and sexual maturation. Low intake of meat or meat alternatives may indicate inadequate availability of these foods at home. Special attention should be paid to children and adolescents who follow a vegetarian diet.</td>
<td>Assess the child or adolescent who is consuming &lt;1 serving of meat or meat alternatives per day.</td>
</tr>
<tr>
<td>For children ≥5:</td>
<td>Consumes excessive amount of fat.</td>
<td>Assess the child or adolescent who has a family history of premature cardiovascular disease. Assess the child or adolescent if body mass index (BMI) is ≥85th percentile.</td>
</tr>
<tr>
<td></td>
<td>Excessive intake of dietary fat contributes to the risk of cardiovascular disease and obesity and is associated with some cancers.</td>
<td></td>
</tr>
<tr>
<td><strong>Eating Behaviors</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Exhibits poor appetite.</td>
<td>A poor appetite may be developmentally appropriate for young children, but in older children and adolescents it may indicate depression or other emotional stress, or a chronic disease.</td>
<td>Assess the child or adolescent if BMI is &lt;15th percentile or if weight loss has occurred. Assess the child or adolescent if irregular menses or amenorrhea has occurred for ≥3 months. Assess the child or adolescent for organic and psychiatric disease.</td>
</tr>
</tbody>
</table>
### TOOL D: KEY INDICATORS OF NUTRITION RISK FOR CHILDREN AND ADOLESCENTS, CONTINUED

<thead>
<tr>
<th>INDICATORS OF NUTRITION RISK</th>
<th>RELEVANCE</th>
<th>CRITERIA FOR FURTHER SCREENING AND ASSESSMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Eating Behaviors, continued</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Consumes food from fast-food restaurants ≥3 times per week.</td>
<td>Excessive consumption of convenience foods and foods from fast-food restaurants is associated with high fat, calorie, and sodium intake, as well as low intake of certain vitamins and minerals.</td>
<td>Assess the child or adolescent who is overweight or obese or who has diabetes mellitus, hyperlipidemia, or other conditions requiring reduction in dietary fat.</td>
</tr>
<tr>
<td>Skips breakfast, lunch, or dinner or supper ≥3 times per week.</td>
<td>Meal-skipping is associated with a low intake of energy and essential nutrients and, if it is a regular practice, could compromise growth and development. Repeatedly skipping meals decreases the nutritional adequacy of the diet.</td>
<td>Assess the child or adolescent to ensure that meal-skipping is not due to inadequate food resources or unhealthy weight-loss practices.</td>
</tr>
<tr>
<td>Has food jags—eats one particular food only.</td>
<td>Food jags, which limit the variety of food consumed, decrease the nutritional adequacy of the diet.</td>
<td>Assess the child's or adolescent's dietary intake over several days.</td>
</tr>
<tr>
<td><strong>Food Resources</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Has inadequate financial resources to buy food, insufficient access to food, or lack of access to cooking facilities.</td>
<td>Poverty can result in hunger and compromised food quality and nutrition status. Inadequate dietary intake interferes with learning.</td>
<td>Assess the child or adolescent who is from a family with low income, is homeless, or is a runaway.</td>
</tr>
<tr>
<td><strong>Weight and Body Image</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Practices unhealthy behaviors (eg, chronic dieting; vomiting; and using laxatives, diuretics, or diet pills to lose weight).</td>
<td>Chronic dieting is associated with many health concerns (eg, fatigue, impaired growth and sexual maturation, irritability, poor concentration, impulse to binge) and can lead to eating disorders. Frequent dieting in combination with purging is associated with health-compromising behaviors (eg, substance use, suicidal behaviors). Purging is associated with serious medical complications.</td>
<td>Assess the child or adolescent for eating disorders. Assess the child or adolescent for organic and psychiatric disease.</td>
</tr>
<tr>
<td>Is excessively concerned about body size or shape.</td>
<td>Eating disorders are associated with significant health and psychosocial morbidity. Eighty-five percent of all cases of eating disorders begin during adolescence. The earlier adolescents are treated, the better their long-term prognosis.</td>
<td>Assess the child or adolescent for distorted body image and dysfunctional eating behaviors, especially if the child or adolescent wants to lose weight but BMI is &lt;85th percentile.</td>
</tr>
<tr>
<td>Exhibits significant weight change in past 6 months.</td>
<td>Significant weight change during the past 6 months may indicate stress, depression, organic disease, or an eating disorder.</td>
<td>Assess the child or adolescent to determine the cause of weight loss or weight gain (eg, limited or too much access to food, poor appetite, meal-skipping, eating disorder).</td>
</tr>
</tbody>
</table>
### TOOL D: KEY INDICATORS OF NUTRITION RISK FOR CHILDREN AND ADOLESCENTS, CONTINUED

<table>
<thead>
<tr>
<th>INDICATORS OF NUTRITION RISK</th>
<th>RELEVANCE</th>
<th>CRITERIA FOR FURTHER SCREENING AND ASSESSMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Growth</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Has BMI &lt;5th percentile.</td>
<td>Thinness may indicate an eating disorder or poor nutrition.</td>
<td>Assess the child or adolescent for eating disorders. Assess the child or adolescent for organic or psychiatric disease. Assess the child or adolescent for inadequate food resources.</td>
</tr>
<tr>
<td>Has BMI &gt;85th percentile.</td>
<td>Overweight children and adolescents are more likely to be overweight adults and are at increased risk for health problems as adults. Obesity is associated with elevated cholesterol levels and elevated blood pressure. Obesity is an independent risk factor for cardiovascular disease and type 2 diabetes mellitus.</td>
<td>Assess the child or adolescent who is at risk for overweight.</td>
</tr>
<tr>
<td><strong>Physical Activity</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is physically inactive:</td>
<td>Lack of physical activity is associated with overweight and obesity, fatigue, and poor muscle tone in the short term, and a greater risk of cardiovascular disease in the long term. Regular physical activity reduces the risk of cardiovascular disease, hypertension, colon cancer, and type 2 diabetes mellitus. Weight-bearing physical activity is essential for normal skeletal development during childhood. Regular physical activity is necessary for maintaining normal muscle strength, joint structure, and joint function; contributes to psychological health and well-being; and facilitates weight reduction and weight maintenance throughout life.</td>
<td>Assess how much time the child or adolescent spends watching television or DVDs and playing computer games. Assess the child’s or adolescent’s definition of physical activity.</td>
</tr>
<tr>
<td>participates in physical activity &lt;5 days per week.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<tr>
<td>physical activity.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lifestyle</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Engages in heavy alcohol,</td>
<td>Alcohol, tobacco, and other drug use can adversely affect nutrient intake and nutrition status.</td>
<td>Assess the child or adolescent further for alcohol, tobacco, and other drug use.</td>
</tr>
<tr>
<td>tobacco, and other drug use.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Uses dietary supplements.</td>
<td>Dietary supplements (eg, vitamin and mineral preparations) can be healthy additions to a diet for children or adolescents with a history of iron-deficiency anemia; however, high doses can have serious side effects. Adolescents who use supplements to “bulk up” may be tempted to experiment with anabolic steroids.</td>
<td>Assess the child or adolescent for the type of supplements used and dosage. Assess adolescent’s use of anabolic steroids and mega doses of other supplements.</td>
</tr>
</tbody>
</table>
Screening for Elevated Blood Lead Levels

Lead is a common environmental contaminant, and exposure to lead is a preventable risk that exists in all areas of the United States. Children ages 1 through 5 have the highest prevalence of elevated blood lead levels (defined as ≥10 μg/dL). According to National Health and Nutrition Examination Survey 1999–2002 data, 1.6% of children ages 1 through 5 had elevated blood lead levels during the study period; the highest prevalence of all age groups. Blood lead levels as low as 10 μg/dL have been associated with adverse effects on cognitive development, growth, and behavior among children ages 1 through 5. High blood levels (ie, ≥70 μg/dL) can cause serious health problems, including seizures, comas, and even death.

The Centers for Disease Control and Prevention (CDC) published guidance to help health professionals working in state and local public health agencies determine which children are at risk for elevated blood lead levels and are most likely to benefit from lead screening. The American Academy of Pediatrics (AAP) supports these guidelines. The following information has been compiled from CDC and AAP guidelines. The Centers for Medicare & Medicaid requires that all children enrolled in Medicaid be screened, because they are at greater risk for elevated blood lead levels than non-enrolled children.

**RISK FACTORS**

Children are at the greatest risk for elevated blood lead levels due to their hand-to-mouth activity, the increased potential for gastrointestinal absorption, and the vulnerability of the central nervous system during the developmental period. Risk factors for elevated blood lead levels among children include:

- Minority race or ethnicity
- Recent immigration or adoption
- From family with low income
- Live in an urban area
- Live in home built prior to 1950
- Live in home recently renovated or remodeled
- Exposure to lead-contaminated dust or soil
- Exposure to lead-glazed pottery
Tool E: Screening for Elevated Blood Lead Levels

- Exposure to lead-based toys, crayons, or cosmetics
- Folk remedy use
- Parents exposed to lead
- Pica
- Iron deficiency
- Developmental delay with oral behaviors
- Abused or neglected

**SCREENING**

Because children with elevated blood lead levels in the 10 to 25 μg/dL range do not develop clinical symptoms, screening is necessary to identify those who need environmental or medical intervention to reduce their blood lead levels.4

To prevent lead poisoning, health professionals should screen children for elevated blood lead levels at age 12 months and consider them again at age 24 months when blood lead levels peak (Box 1), except in communities with sufficient data to conclude that children are not at risk for lead exposure. In addition, health professionals should assess children’s risk for elevated blood lead levels at ages 6, 9, and 18 months and at ages 3, 4, 5, and 6 years. If a child tests positive, appropriate action should follow.5

**SCREENING FOR CHILDREN ENROLLED IN MEDICAID**

Blood lead level screening is required at age 1 and 2 years for all children who are enrolled in Medicaid as part of prevention services provided through the Early and Periodic Screening, Diagnosis, and Treatment program. All children ages 36 to 72 months who have not been previously screened must also receive a blood lead test. Children with elevated blood lead levels require further evaluation and appropriate follow-up care.8

**ANTICIPATORY GUIDANCE**

Health professionals should provide anticipatory guidance on lead exposure to parents of all infants and young children, including information on risk factors and specific prevention strategies (Table 1).4

- Discuss with parents sources of lead, and help them identify sources of lead in their child's environment.
- Obtain an environmental and family occupational history, and educate parents about the most common sources of childhood lead exposure for their child and in their community.
- Encourage parents to identify lead hazards and sources in their homes and to reduce their child's potential for exposure to lead.
- Warn parents about the dangers posed by unsafe renovation methods, and explain that they need to be cognizant of the possibility of new and reemerging sources of lead in children’s environments.
- Direct parents to local, state, and federal agencies and organizations for information, particularly concerning methods to identify and safely repair lead hazards.9
- Discuss with parents the potential impact of lead on child development, and promote strategies that foster optimal development, including providing nurturing and enriching experiences.
- For all children from families with low incomes living in areas where exposure to lead is likely, promote participation in early enrichment programs, regardless of the child’s blood lead levels.9

**BOX 1. SCREENING FOR LEAD EXPOSURE IN CHILDREN**

1. Does your child live in or regularly visit a home or child-care facility that was built before 1950?
2. Does your child live in or regularly visit a home or child-care facility built before 1978 that is being or has recently been renovated or remodeled (within the last 6 months)?
3. Does your child have a sibling or playmate who has or did have lead poisoning?

### Strategies for Health Professionals to Promote Healthy Eating Behaviors

<table>
<thead>
<tr>
<th>STRATEGIES</th>
<th>APPLICATIONS/QUESTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Communication Factors</strong></td>
<td></td>
</tr>
<tr>
<td>Promote positive, nonjudgmental strategies to help the child or adolescent adopt healthy eating behaviors.</td>
<td>Reinforce positive aspects of the child’s or adolescent’s eating behaviors.</td>
</tr>
<tr>
<td>Encourage the child’s or adolescent’s active participation in changing eating behaviors.</td>
<td>Help the child or adolescent identify barriers that make it difficult to change eating behaviors, and develop a plan of action for adopting new behaviors.</td>
</tr>
<tr>
<td>Provide concrete learning situations.</td>
<td>Use charts, food models, and videotapes to reinforce verbal information and instructions.</td>
</tr>
<tr>
<td>Focus on the short-term benefits of healthy eating behaviors.</td>
<td>Emphasize that healthy eating behaviors will make the child or adolescent feel good and have more energy.</td>
</tr>
<tr>
<td>Understand and respect the child’s or adolescent’s cultural eating behaviors.</td>
<td>Help the child or adolescent integrate cultural eating behaviors with dietary recommendations.</td>
</tr>
<tr>
<td>Use simple terminology.</td>
<td>Avoid using the term diet with the child or adolescent because it tends to be associated with weight loss and may be confusing.</td>
</tr>
<tr>
<td><strong>Environmental Factors</strong></td>
<td></td>
</tr>
<tr>
<td>Create an office or clinic environment oriented to children or adolescents.</td>
<td>Use posters and materials written for children or adolescents.</td>
</tr>
<tr>
<td>Communicate developmentally appropriate health messages.</td>
<td>Use posters and materials that highlight the importance of healthy eating behaviors.</td>
</tr>
<tr>
<td>Encourage health professionals and staff to become role models for healthy eating behaviors.</td>
<td>Have health professionals and staff model healthy eating behaviors.</td>

</table>
## TOOL G: STRATEGIES FOR HEALTH PROFESSIONALS TO PROMOTE HEALTHY EATING BEHAVIORS, CONTINUED

<table>
<thead>
<tr>
<th>STRATEGIES</th>
<th>APPLICATIONS/QUESTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Readiness to Change</td>
<td></td>
</tr>
<tr>
<td>Identify the child’s or adolescent’s stage of behavior change and readiness to change based on the Stages of Change model (Tool F).</td>
<td>“Do you want to change the way you eat?” “Are you thinking about changing the way you eat?” “Are you ready to change the way you eat?” “Are you changing the way you eat?” “Are you trying to keep eating the way you have been?”</td>
</tr>
<tr>
<td>Facilitate behavior change with counseling strategies tailored to the child or adolescent based on the Stages of Change model (Tool F).</td>
<td>Provide a supportive environment, basic information, and assessment. Prioritize behaviors to be changed, set goals, and identify barriers to change. Develop a plan that incorporates incremental steps for making changes, support, and reinforcement.</td>
</tr>
<tr>
<td>Action Plans</td>
<td></td>
</tr>
<tr>
<td>Provide counseling for the child or adolescent who is in the early stages of behavior change or who is unwilling to change.</td>
<td>Increase the child’s or adolescent’s awareness and knowledge of eating behaviors. Encourage the child or adolescent to make behavior changes.</td>
</tr>
<tr>
<td>Provide task-oriented counseling for the child or adolescent who is ready to change eating behaviors.</td>
<td>Encourage a few small, concrete changes first, and build on those. Support and follow up with the child or adolescent who has changed behavior.</td>
</tr>
<tr>
<td>Identify and prioritize behavior changes to be made.</td>
<td>Suggest changes that will have a measurable impact on the child’s or adolescent’s most serious nutrition issues.</td>
</tr>
<tr>
<td>Set realistic, achievable goals that are supported by the child’s or adolescent’s family.</td>
<td>“What will you change?” “What goal is realistic right now?” “How and when will you change, and who will help you?”</td>
</tr>
<tr>
<td>Identify and address barriers to behavior change; help reduce barriers when possible.</td>
<td>“What could make it hard for you to make this change—money, friends, or family?” “How can you get around this?”</td>
</tr>
<tr>
<td>Make sure that the behavior changes are compatible with the child’s or adolescent’s lifestyle.</td>
<td>Don’t expect the child or adolescent to conform to rigid eating behaviors. Keep in mind current behaviors and realistic goals.</td>
</tr>
<tr>
<td>Establish incremental steps to help the child or adolescent change eating behaviors.</td>
<td>For example, have the child or adolescent reduce fat consumption by changing the type of milk consumed, from reduced-fat (2%), to low-fat (1%), to fat-free (skim) milk.</td>
</tr>
<tr>
<td>Encourage the child or adolescent to commit to behavior changes with contracts.</td>
<td>Discuss non-food rewards (incentives) to help the child or adolescent focus on changing eating behaviors.</td>
</tr>
<tr>
<td>Give the child or adolescent responsibility for changing and monitoring eating behaviors.</td>
<td>Stress the importance of planning how the child or adolescent will make and track changes in eating behavior. Make record-keeping simple, and review the plan with the child or adolescent.</td>
</tr>
</tbody>
</table>
### TOOL G: STRATEGIES FOR HEALTH PROFESSIONALS TO PROMOTE HEALTHY EATING BEHAVIORS, CONTINUED

<table>
<thead>
<tr>
<th>STRATEGIES</th>
<th>APPLICATIONS/QUESTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Help the child or adolescent obtain family and peer support.</td>
<td>Discuss how the child or adolescent can encourage parents and peers to help. Meet with parents to clarify goals and action plans; determine how they can help. Provide nutrition education or counseling to parents, as appropriate.</td>
</tr>
<tr>
<td>Offer feedback and reinforce successes.</td>
<td>Show interest to encourage continued behavior change.</td>
</tr>
</tbody>
</table>

**General Strategies**

<table>
<thead>
<tr>
<th>STRATEGIES</th>
<th>APPLICATIONS/QUESTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ask the child or adolescent about changes in eating behaviors at every visit.</td>
<td>“How are you doing in changing the way you eat?”</td>
</tr>
<tr>
<td>Emphasize to the child or adolescent the consumption of foods rather than nutrients.</td>
<td>For example, say, “drink more milk, and eat more cheese, and yogurt” rather than “you need more calcium.”</td>
</tr>
<tr>
<td>Build on positive aspects of the child’s or adolescent’s eating behaviors.</td>
<td>“It’s great that you’re eating breakfast. Would you be willing to try cereal, fruit, and toast instead of bacon and doughnuts 4 days a week?”</td>
</tr>
<tr>
<td>Focus on “how to” instead of “why” information.</td>
<td>Share behaviorally oriented information (eg, what, how much, and when to eat and how to prepare food) rather than focusing on why the information is important.</td>
</tr>
<tr>
<td>Provide counseling that integrates realistic behavior change into the child’s or adolescent’s lifestyle.</td>
<td>“I understand that your friends eat lunch at fast-food restaurants. Would it help you to learn how to make healthier food choices at these restaurants?”</td>
</tr>
<tr>
<td>Discuss how to make healthy food choices in a variety of settings.</td>
<td>Talk about how to choose foods in various settings such as fast-food and other restaurants, convenience stores, vending machines, and friends’ homes.</td>
</tr>
<tr>
<td>Provide the child or adolescent with learning experiences and skills practice.</td>
<td>Practice problem-solving and role-playing (eg, having the child or adolescent ask the food server to hold the mayonnaise).</td>
</tr>
<tr>
<td>Introduce the concept of achieving balance and enjoying all foods in moderation.</td>
<td>“Your food record shows that after having pepperoni pizza for lunch yesterday, you ate a lighter dinner. That’s a good way to balance your food intake throughout the day.”</td>
</tr>
<tr>
<td>Make record-keeping easy, and tell the child or adolescent that you do not expect spelling, handwriting, and eating behaviors to be perfect.</td>
<td>“Be as accurate and honest as you can as you record your food intake. This record is a tool to help you think about how you eat.”</td>
</tr>
<tr>
<td>Make sure that the child or adolescent hears what you are saying.</td>
<td>“What are you planning to work on before your next appointment?”</td>
</tr>
<tr>
<td>Make sure that you and the child or adolescent define terms in the same way to avoid confusion.</td>
<td>Discuss the definition of words that may cause confusion, such as “fat,” “calories,” “meal,” and “snack.”</td>
</tr>
<tr>
<td>When assessing food intake, keep in mind that a child’s or adolescent’s portion size may not be the same as a standard serving size.</td>
<td>Use food models or household cups and bowls to clarify serving sizes.</td>
</tr>
</tbody>
</table>
Basics for Handling Food Safely

Safe food handling, cooking, and storage are essential to prevent food-borne illness. You can't see, smell, or taste harmful bacteria that may cause illness. In every step of food preparation, follow 4 guidelines to keep food safe.

- **Clean**—Wash hands and surfaces often.
- **Separate**—Don’t cross-contaminate.
- **Cook**—Cook to proper temperatures.
- **Chill**—Refrigerate promptly.

### SHOPPING

- Buy refrigerated or frozen items after selecting non-perishable food.
- Never buy meat or poultry in packaging that is torn or leaking.
- Never buy food after “sell-by,” “use-by,” or other expiration dates.

### STORAGE

- Always refrigerate perishable food within 2 hours (1 hour when the temperature is above 90°F).
- Check the temperatures of your refrigerator and freezer with an appliance thermometer. The refrigerator should be at 40°F or below and the freezer at 0°F or below.
- Cook or freeze fresh poultry, fish, ground meat, and variety meat (eg, calf’s tongue) within 2 days; cook or freeze other beef, veal, lamb, or pork within 3 to 5 days.
- Make sure perishable food such as meat and poultry is wrapped securely to maintain quality and to prevent meat juices from coming into contact with other food.
- To maintain quality when freezing meat and poultry in its original package, wrap the package again with foil or plastic wrap that is recommended for the freezer.
- In general, canned high-acid foods such as tomatoes, grapefruit, and pineapple can be stored for 12 to 18 months. Canned low-acid foods such as meat, poultry, fish, and most vegetables can be stored for 2 to 5 years if the can remains in good condition and has been kept in a cool, clean, and dry place. Discard cans that are dented, leaking, bulging, or rusted.
**PREPARATION**
- Always wash your hands with warm water and soap for 20 seconds before and after handling food.
- Don't cross-contaminate. Keep raw meat, poultry, fish, and their juices away from other food. After cutting raw meat, wash the cutting board, utensils, and countertops with hot, soapy water.
- Sanitize cutting boards, utensils, and countertops with a solution of 1 tablespoon of unscented, liquid chlorine bleach in 1 gallon of water.
- Marinate meat and poultry in a covered dish in the refrigerator.

**THAWING**
- Refrigerator: The refrigerator allows slow, safe thawing. Make sure thawing meat and poultry juices do not drip onto other food.
- Cold water: For faster thawing, place food in a leak-proof plastic bag and submerge the bag in cold tap water. Change the water every 30 minutes. Cook immediately after thawing.
- Microwave: For fastest thawing, use the microwave. Place food in cookware that is manufactured for use in the microwave and cover with a lid or microwave-safe plastic wrap to hold in moisture and provide safe, even heating. Cook meat, poultry, egg casseroles, and fish immediately after microwave thawing.

**COOKING (MINIMAL INTERNAL TEMPERATURE)**
- Beef, veal, and lamb steaks; roasts; and chops cooked to 145°F
- All cuts of pork cooked to 160°F
- Ground beef, veal, and lamb cooked to 160°F
- Poultry cooked to 165°F

**SERVING**
- Hot food should be held at 140°F or warmer.
- Cold food should be held at 40°F or colder.
- At buffets, keep food hot with chafing dishes, slow cookers, and warming trays. Keep food cold by nesting dishes in bowls of ice.
- Perishable food should not be kept at room temperature for more than 2 hours (1 hour when the temperature is above 90°F).

**LEFTOVERS**
- Discard any perishable food kept at room temperature for more than 2 hours (1 hour if the temperature was above 90°F).
- Place perishable food in shallow containers and immediately put it in the refrigerator or freezer for rapid cooling.
- Use cooked leftovers within 4 days.

**REFREEZING**
- Meat and poultry defrosted in the refrigerator may be refrozen before or after cooking. For meat thawed by other methods, cook before refreezing.

**Tips for Fostering a Positive Body Image Among Children and Adolescents**

<table>
<thead>
<tr>
<th>CHILD OR ADOLESCENT</th>
<th>PARENTS</th>
<th>HEALTH PROFESSIONAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Look in the mirror and focus on your positive features, not your negative ones. Say something nice to your friends about how they look. Think about your positive traits that are not related to appearance. Look at magazines with a critical eye, and find out what photographers and graphic designers do to make models look the way they do. If you are overweight and want to lose weight, be realistic in your expectations, and aim for gradual change. Realize that everyone has a unique size and shape. If you have questions about your size or weight, ask a health professional.</td>
<td>Model healthy eating and physical activity behaviors, and avoid extreme eating and physical activity behaviors. Focus on non-appearance-related traits when discussing yourself and others. Praise your child or adolescent for academic and other successes. Analyze media messages with your child or adolescent. Show that you love your child or adolescent regardless of what he weighs. If your child or adolescent is overweight, don't criticize her appearance—offer support instead. Share with a health professional any concerns you have about your child’s or adolescent’s eating behaviors or body image.</td>
<td>Discuss changes that occur during adolescence. Assess weight concerns and body image. If a child or adolescent has a distorted body image, explore causes and discuss potential consequences. Discuss how the media negatively affects body image. Discuss normal variation in body sizes and shapes among children and adolescents. Educate parents, physical education instructors, and coaches about realistic and healthy body weights. Emphasize the positive characteristics (related to appearance and not related to appearance) of children and adolescents you see.</td>
